

Weekly “People Connected” Count

Integration guide for the call system

The About page on homeservices.guru shows how many people Home Services Guru connected with a local pro this year, for example **“4,300+ People connected with a local pro in 2026”**. Your system sends the number once a week, and the page updates immediately. No deploy is needed.

1. Endpoint

Method	POST
URL (live site)	`https://homeservices.guru/api/stats/connected`
URL (until launch)	`https://homeguru.solitary-wind-193d.workers.dev/api/stats/connected` Use this address until homeservices.guru is switched to the new site. We'll tell you when to change it.
Schedule	Once a week, Sunday night. Sending more often is fine. The latest value wins.
Auth	`Authorization: Bearer <STATS_TOKEN>`
Body	`Content-Type: application/json`

2. Request body

```
{"count": 4317, "year": 2026}
```

Field	Type	What it is
`count`	integer ≥ 0	Unique callers connected so far in *year*: people whose call was put through to a provider, **counting each phone number once**. Send the exact number. The site does the rounding.
`year`	integer	The calendar year the count covers, for example 2026. The site accepts the current year, or the previous year for a run that lands just after New Year's. Sending a new year's count switches the page to that year.

The count is a running year-to-date total, so it should never go down within a year. The site rejects a lower number as a likely reporting error.

3. Example

```
curl -X POST https://homeguru.solitary-wind-193d.workers.dev/api/stats/connected \
  -H "Authorization: Bearer $STATS_TOKEN" \
  -H "Content-Type: application/json" \
  -d '{"count": 4317, "year": 2026}'

# 200 OK
{"ok": true,
 "stored": {"count": 4317, "year": 2026, "updatedAt": "2026-11-08T05:00:00.000Z"},
 "shown": "4,300+"}
```

4. Responses

Status	Meaning	What to do
200	Saved. `shown` is what the page displays (`null` under 100).	Nothing.
400	Body isn't JSON, `count` isn't a whole number, or `year` is out of range.	Fix the request. Don't retry as-is.
401	Missing or wrong token.	Check the token in your config.
405	Not a POST.	Use POST.
409	Count is lower than the last one for that year, or the year is older than the one shown. Not saved.	Check the report. Alert someone.
422	Count jumped more than 10× in one week. Not saved.	Check the report, then resend.
503	The site's token or storage isn't set up yet.	Tell the site owner.
5xx / network	Temporary problem.	Retry a few times with backoff.

Error bodies look like `{"error": "...", "stored": {...}}`, where `stored` is the value currently shown. Please log every non-200 response and alert on it. Retry only 5xx and network errors, never 4xx.

5. How the number is shown

Count sent	About page shows
No count yet, or under 100	“Since 2018 · Connecting people with local pros” (no number)
100 – 9,999	Rounded down to the hundred: 4,317 → “4,300+”
10,000 and up	Rounded down to the thousand: 12,480 → “12,000+”

6. Setup checklist

1. **Generate a token.** Use a long random value, for example from `openssl rand -hex 32`. Store it in your system's secret config, not in source code.
2. **Send the token to the site owner over a secure channel**, such as a password manager share, not plain email or chat. They load it into the site. Until they do, the endpoint returns 503.
3. **Schedule the job** for Sunday night to POST the current year-to-date count to the preview URL above.
4. **Test once by hand.** Confirm you get 200 and that `shown` matches what you expect. The preview About page should then show the number.
5. **At launch**, switch the URL to `https://homeservices.guru/api/stats/connected`. The token stays the same.
